# EVK SQALAR

## Software Tool for determination of chemical concentrations in materials

- Qualitative and Quantitative analysis
- For sorting, inspection and monitoring applications
- In-line, at-line and in the laboratory

**Description** EVK SQALAR software enables monitoring and measuring of user-defined properties of individual objects or bulk material streams and helps to increase the quality, consistency and safety of products and at all stages of industrial processing.

Acting as a multifunctional quantitative analysis software tool for multivariate measurements of chemical properties it is suitable for sorting, inspection and monitoring applications, both in-line and at-line and also in laboratories. The EVK SQALAR in combination with the EVK HELIOS Hyperspectral imaging systems enables a non-invasive, interruption-free, measurement of chemical concentrations of all objects in a product stream.

- Key features**
- Qualitative and quantitative chemical analysis in-line, at-line and in the lab
  - In-situ results of the full product stream
  - Intuitive instructive modeling environment
  - Instant validation of generated model
  - Statistical figures of merit
  - High precision measurement of substance concentration

- Client benefits**
- Increase quality, consistency and safety of products
  - Full control of user defined properties of the entire product stream
  - Product safety in fields with highest legal or standard requirements

- Typical applications**
- Material type determination based on its chemical composition in recycling industry
  - Determination of calorific value of refuse derived fuels
  - Detection of poisonous compounds in food industry
  - Analysis and monitoring of nutrients, moisture, proteins, fat, pH values
  - Separation of mineral types and rock
